Design in the age of artificial intelligence

Computational generative design, the digitalisation of spatial usage data or the nature of our future lives in the metaverse are, to name just a few, topics which have been explored at schools of design for some time already. In this context, the interest amongst students, scholars and all design professionals in keeping their practice at the cutting edge of technology is, undoubtedly, rising.

If artificial intelligence is everywhere (from the apps on our phones to the algorithms of search engines), how is it transforming the design of buildings, cities and landscapes? As we move from form to information, will artificial intelligence replace designers? As the Planet is already

being governed by information technology, what are the transferable skills for designers to be used elsewhere? In the midst of a climate breakdown, can digitalisation improve our relationship with our natural environment? Can AI empower communities and societies become more transparent and inclusive, or is AI a weapon for inequality?

At this BK Talks, we will be discussing what artificial intelligence is, how it works and, most importantly, what this means to the world of design. We will further be exploring new discourses, other means of expression and new ways of theorising technology and design.
